

“Baby Bowser was born with a genetic condition called Entropion. This condition causes his eyelids to roll in resulting in his eyelashes continously rubbing directly on the eyes. Without proper treatment this condition leads to ulcers on the eyes, blindness, infection and eventually the loss of his eyes. Baby Bowser underwent a surgical procedure on October 10th 2017 to correct the Entropion. So far, he is doing very well and is expected to have no complications. We would like to thank all of the donors who make treatment possible for Baby Bowser and other furbabies like him.”
