“Bella was coughing, shaking violently, and throwing up just after the new year. We took her to our family veterinarian to see what was causing the issues. They originally through that she had eaten something that was blocking her GI track causing her to throw up. When she arrived at vet's office she was running a fever of 105. By that same afternoon, my vet called to inform me that she would not make it throughout the night if she was not immediately transferred to the doggy ER. The diagnosed her with pneumonia. They placed her on IV fluids, antibiotics, and placed her in a specialized oxygen kennel to restore her dying lungs. She received this treatment for the first 24 hours of care at the ER. She remained in their care for a total of 64 hours. She was discharged on Friday morning, but will still be battling pneumonia for another week. She will receive special care from her owner every 4 to 8 hours to help clear up the pneumonia and will be on antibiotics for two weeks. She returns to our family veterinarian late next week for a progress report. Bella would like to thank all of the donors at Paws 4 A Cure for helping provide for her life-saving treatments over the last 64 hours. “
